Sort Order: Treatment

Product quantities required for listed treatments and applications in one trial:

Amount*	Unit	Treatment Name	Form Conc	Form Type	Lot Code
---------	------	----------------	-----------	-----------	----------

\* 'Per area' calculations based on spray volume= 14.8 gal/ac, mix size= 1 liters (mix size basis).  
 \* Product amount calculations increased 25 % for overage adjustment.

### Trial Comments

**OBJECTIVE:** Evaluate nutsedge and cucumber response to various DMDS rates applied under LDPE and metalized mulch.

**CROP RESPONSE:**

1. For visual stunting at 11 to 13 d after transplant, plant date main effect and a fumigant by mulch interaction were noted. Pooled over mulch and fumigant, injury was reduced from 7% to 3% by waiting 2 d after poking the hole in the mulch prior to transplanting. When pooled over plant date, injury was less than 5% except when 50 G of DMDS (9%), 62 G of DMDS (12%), or 74 G of DMDS (25%) were applied under metalized mulch.
2. Approximately 45 days after transplanting when measuring runner length on 10 plants per plot, there was a fumigant by mulch interaction. Cucumber in MB plots was similar in size to all other plots except when no fumigant was applied or when 50 (19% smaller), 62 (27% smaller), or 74 G (44%) of DMDS were applied under metalized mulch.

**VISUAL NUTSEDGE CONTROL:**

1. At 27, 60 or 83 d after fumigating, fumigant main effects were significant. Pooled over mulch and plant date, DMDS at 38 G was less effective than 50, 62, or 74 G in controlling nutsedge. After 60 d of fumigating, 74 G was more effective than any other rate of DMDS.
2. DMDS at 74 G was as effective as MB at 60 d after fumigating but was 7% less effective than MB by 83 d; however, control by 74 G of DMDS was still excellent and consistent with control ranging from 92 to 96% in individual plots.
3. Mulch type had no impact on control.

# University of Georgia

## NUTSEDGE EMERGENCE COUNTS (entire plot counted):

1. As early as 28 d after fumigating, 38 G DMDS was less effective than other DMDS rates when pooled over plant date and mulch type. By 41 d, 74 G was more effective than lower rates with little difference noted when comparing 50 and 62 G DMDS.
2. DMDS at 74 G and MB provided similar control with a trend for slightly more nutsedge in the DMDS system by 83 d after fumigating.
3. Mulch had no impact on nutsedge emergence counts after 14 d of fumigating.

## CUCUMBER YIELD:

1. Fumigant option did not statistically impact the first three harvest. However for harvest 4 and 5, differences were noted with less yield in the non-treated or in the 74 G of DMDS plots.
2. When adding all 7 harvest dates, yield was similar to MB with only the 38 G of DMDS which suggest plant back interval played a key role in yield with increasing rates of DMDS + Pic.
3. When adding all harvest dates, 11% less yield was noted when cucumber was transplanted 14 d after fumigating when compared to planting on day 16 (2 d after the holes were poked in the mulch).

## CONCLUSIONS:

1. For nutsedge control, DMDS should be applied at 74 G in the spring crop.
2. With the Pic in the DMDS mixture, we need to further evaluate plant back intervals and crop tolerance in a weed free environment.
3. We need to begin evaluating weeds, other than nutsedge, and their response to DMDS mixtures.

## GENERAL COMMENTS:

1. All fumigant treatments applied 8 inches deep with a super bedder plastic layer.
2. LDPE mulch was black on black 1.25 mil; metalized mulch was silver on black 1.3 mil.
